# Problem Description

- 1. Aerial Images → Orthophoto (Framework, Literature)
- 2. Correcting Orthophotos (Suggested Method)
- 3. Preliminary Results & Future Work

- When going from separate images to an orthophoto, a three-dimensional reconstruction is required.
- Crucial for doing so is the **Essential matrix**.

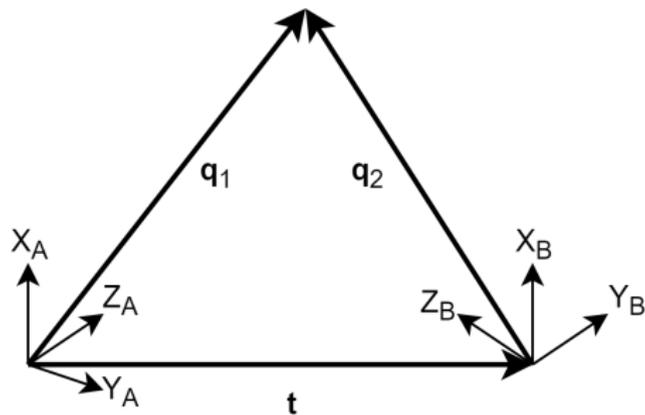

# Framework - Essential Matrix

# Framework - Essential Matrix

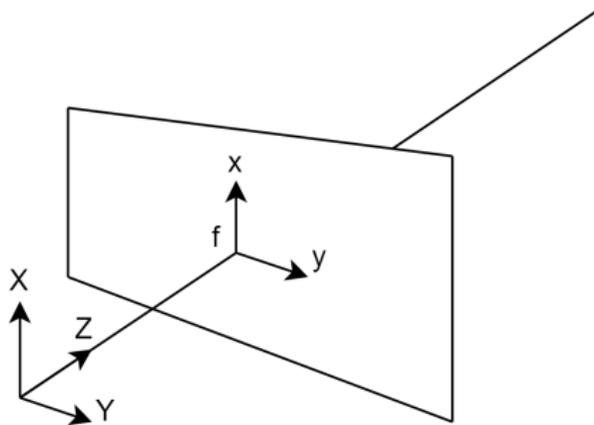

# Framework - Essential Matrix

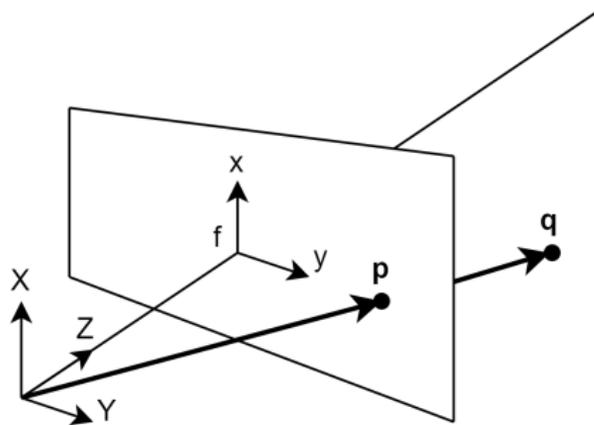

- $\mathbf{q}_1 \cdot \underbrace{\mathbf{t} \times \mathbf{R} \mathbf{q}_2}_E = 0$

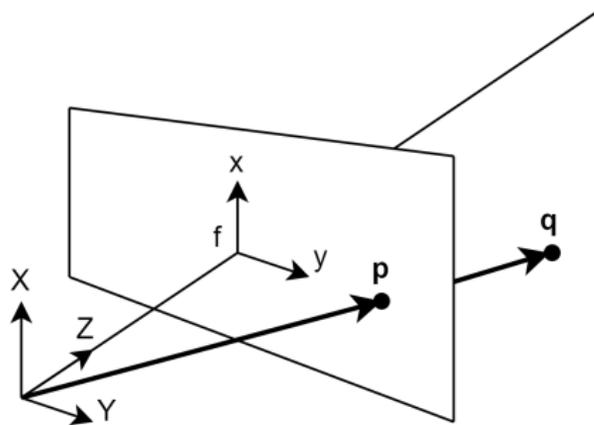

# Framework - Essential Matrix

# Framework - Essential Matrix

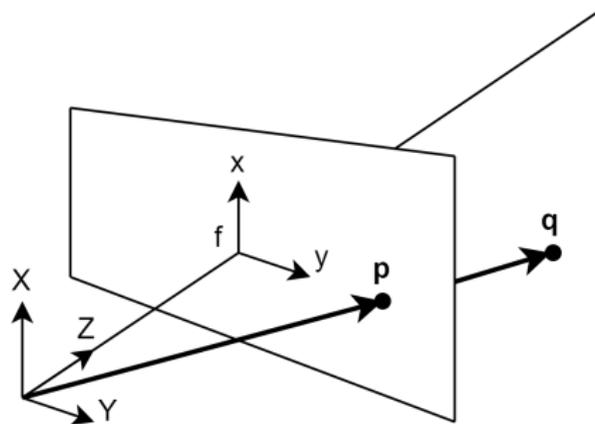

# Framework - Essential Matrix

- $$\mathbf{p} = \begin{bmatrix} p^x \\ p^y \\ 1 \end{bmatrix} = \frac{1}{q^Z} \begin{bmatrix} q^X \\ q^Y \\ q^Z \end{bmatrix} = \frac{1}{q^Z} \mathbf{q}$$

# Framework - Essential Matrix

$$\bullet \mathbf{p} = \begin{bmatrix} p^x \\ p^y \\ 1 \end{bmatrix} = \frac{1}{q^Z} \begin{bmatrix} q^X \\ q^Y \\ q^Z \end{bmatrix} = \frac{1}{q^Z} \mathbf{q}$$

$$\bullet \mathbf{q}_1^T E \mathbf{q}_2 = 0 \quad \implies \quad \mathbf{p}_1^T E \mathbf{p}_2 = 0$$

- $$\begin{bmatrix} p_1^x p_2^x & p_1^x p_2^y & \dots & p_2^y & 1 \end{bmatrix} \begin{bmatrix} E_{11} \\ \vdots \\ E_{33} \end{bmatrix} = 0$$

- $\begin{bmatrix} p_1^x p_2^x & p_1^x p_2^y & \dots & p_2^y & 1 \end{bmatrix} \begin{bmatrix} E_{11} \\ \vdots \\ E_{33} \end{bmatrix} = 0$
- $Ax = 0$

- $[p_1^x p_2^x \quad p_1^x p_2^y \quad \dots \quad p_2^y \quad 1] \begin{bmatrix} E_{11} \\ \vdots \\ E_{33} \end{bmatrix} = 0$
- $Ax = 0$
- “Eight-point problem”

- I **Keypoint Identification**
- II **Keypoint Matching**
- III **Filtering & Fitting  $E$**
- IV Keypoint Triangulation
- V Dense Pointcloud
- VI Create Orthophoto

## *1. Keypoint Identification.*

- Extract keypoint locations  $\mathbf{p}_i$ .
- Describe each keypoint  $i$  in  $\mathbf{f}_i$ .

# Framework - Common Pipeline

## *I. Keypoint Identification.*

- Extract keypoint locations  $\mathbf{p}_i$ .
- Describe each keypoint  $i$  in  $\mathbf{f}_i$ .

## *II. Keypoint Matching.*

- Image  $A$  with keypoints  $i \in S^A$  and image  $B$  with keypoints  $i \in S^B$ .

## II. Keypoint Matching.

- Image  $A$  with keypoints  $i \in S^A$  and image  $B$  with keypoints  $i \in S^B$ .
- Candidate match for  $i \in S^A$  is:  $\iota = \arg \min_{\tau \in S^B} \|\mathbf{f}_i - \mathbf{f}_\tau\|$ .

## II. Keypoint Matching.

- Image  $A$  with keypoints  $i \in S^A$  and image  $B$  with keypoints  $i \in S^B$ .
- Candidate match for  $i \in S^A$  is:  $\iota = \arg \min_{\tau \in S^B} \|\mathbf{f}_i - \mathbf{f}_\tau\|$ .
- Accept if:  $\|\mathbf{f}_i - \mathbf{f}_\iota\| < C \min_{\kappa \in S^B \setminus \{\iota\}} \|\mathbf{f}_i - \mathbf{f}_\kappa\|$ , with  $C \leq 1$ .

### *III. Filtering & Fitting $E$ .*

- Image pair with a set ( $> 8$ ) matches ( $\mathbf{p}_i \leftrightarrow \mathbf{p}_l$ ).

## III. Filtering & Fitting $E$ .

- Image pair with a set ( $> 8$ ) matches ( $\mathbf{p}_i \leftrightarrow \mathbf{p}_l$ ).
- Fit  $E$  using RANSAC (Random Sample Consensus):
  - 1: **for**  $N$  iterations **do**
  - 2:   select eight random ( $\mathbf{p}_i \leftrightarrow \mathbf{p}_l$ ) and determine  $\tilde{E}$
  - 3:   count inliers that satisfy  $(\mathbf{p}_i)^T \tilde{E} \mathbf{p}_l < \varepsilon$
  - 4:   **if** count  $>$  best **then**
  - 5:      $E \leftarrow \tilde{E}$ , best  $\leftarrow$  count
  - 6:   **end if**
  - 7: **end for**

- ❶ **Keypoint Identification**
- ❷ **Keypoint Matching**
- ❸ **Filtering & Fitting  $E$**

- ← New way of extracting  $p_i$  and  $f_i$
- ← Use in exact same way
- ← Use in more or less same way

## Method - New Keypoints

# Method - New Keypoints

## Method - New Keypoints

- Crop parametrization:

$$\mathbf{r}(\xi, t) = r(\xi, t)\mathbf{n}(\xi) + \mathbf{c}, \quad \mathbf{n} = \langle \cos \xi, \sin \xi \rangle$$

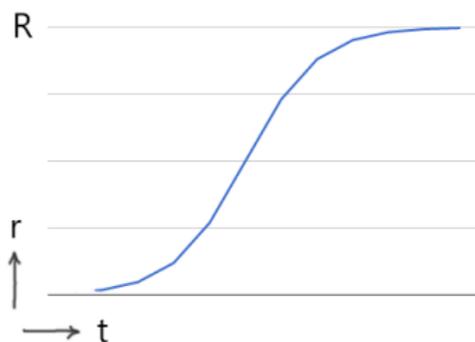

# Method - New Keypoints

- Crop parametrization:

$$\mathbf{r}(\xi, t) = r(\xi, t)\mathbf{n}(\xi) + \mathbf{c}, \quad \mathbf{n} = \langle \cos \xi, \sin \xi \rangle$$

- Growth model:

$$\frac{\partial r}{\partial t} = \alpha r \left(1 - \frac{r}{R}\right)$$

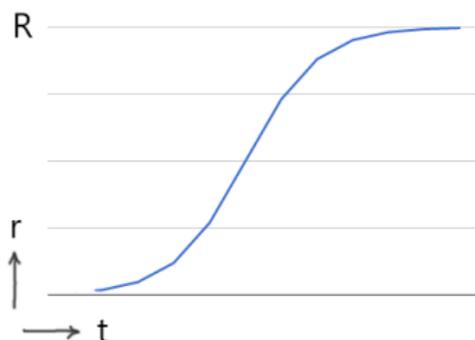

# Method - New Keypoints

- Crop parametrization:

$$\mathbf{r}(\xi, t) = r(\xi, t)\mathbf{n}(\xi) + \mathbf{c}, \quad \mathbf{n} = \langle \cos \xi, \sin \xi \rangle$$

- Growth model:

$$\frac{\partial r}{\partial t} = \alpha r \left(1 - \frac{r}{R}\right)$$

- Observe order preservation:

$$r_a(\xi_a, t_0) > r_b(\xi_b, t_0) \implies r_a(\xi_a, t) > r_b(\xi_b, t) \quad \text{for } t > t_0$$

- $p_i = c_i$

- $\mathbf{p}_i = \mathbf{c}_i$
- $\mathbf{f}_i = \{r_i(\xi_j) \mid \xi_j = j \frac{2\pi}{m}, j = 1, \dots, m\}$

# Method - New Keypoints

- $\mathbf{p}_i = \mathbf{c}_i$
- $\mathbf{f}_i = \{r_i(\xi_j) \mid \xi_j = j \frac{2\pi}{m}, j = 1, \dots, m\}$
- Global normalisation:

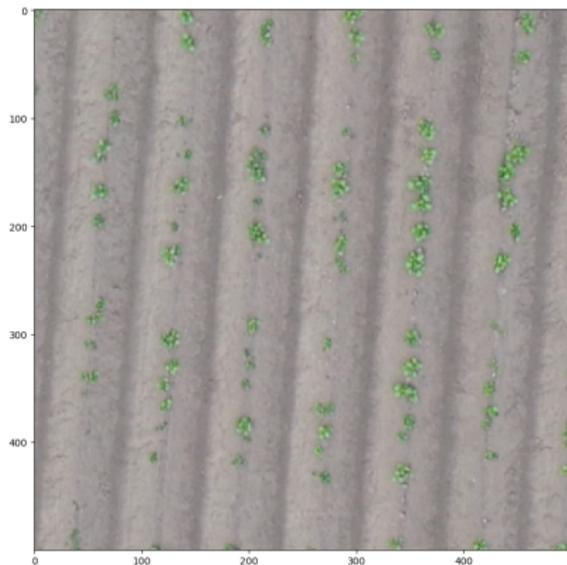

# Method - New Keypoints

- $\mathbf{p}_i = \mathbf{c}_i$
- $\mathbf{f}_i = \{r_i(\xi_j) \mid \xi_j = j \frac{2\pi}{m}, j = 1, \dots, m\}$
- Global normalisation:
  - $F = \{f_{i,j} \mid \forall i, j\}$

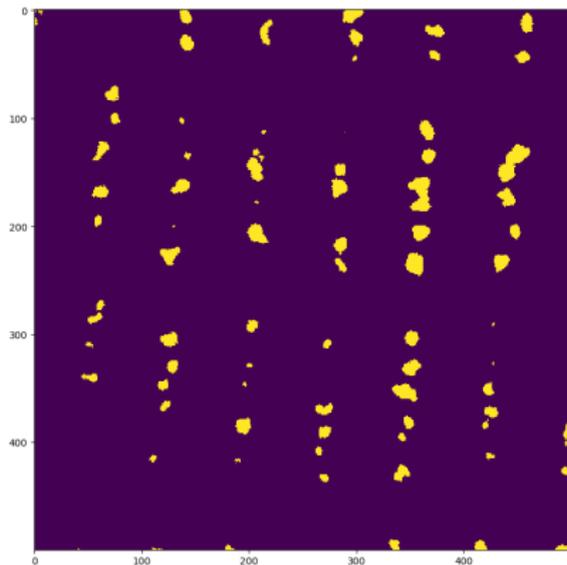

- $\mathbf{p}_i = \mathbf{c}_i$
- $\mathbf{f}_i = \{r_i(\xi_j) \mid \xi_j = j \frac{2\pi}{m}, j = 1, \dots, m\}$
- Global normalisation:
  - $F = \{f_{i,j} \mid \forall i, j\}$
  - $\mathbf{l} = \{F_v \mid v = 0, \dots, 100\}$

- $\mathbf{p}_i = \mathbf{c}_i$
- $\mathbf{f}_i = \{r_i(\xi_j) \mid \xi_j = j \frac{2\pi}{m}, j = 1, \dots, m\}$
- Global normalisation:
  - $F = \{f_{i,j} \mid \forall i, j\}$
  - $\mathbf{l} = \{F_v \mid v = 0, \dots, 100\}$
  - $f_{i,j} \leftarrow v \quad \text{if } l_v \leq f_{i,j} < l_{v+1}$

# Preliminary Results

# Preliminary Results

# Preliminary Results

- Implement RANSAC fitting of  $E$  (?) and use it to correct orthophoto.

- Implement RANSAC fitting of  $E$  (?) and use it to correct orthophoto.
- Testing effectiveness of method under various conditions and parameter settings.

- Implement RANSAC fitting of  $E$  (?) and use it to correct orthophoto.
- Testing effectiveness of method under various conditions and parameter settings.
- Extension of method for merging canopies, which would require extra preprocessing.
