Matrix-Free Parallel Scalable Multilevel Deflation for the Helmholtz Equation

Jingiang Chen

Technische Universiteit Delft

Aim and Impact

- Joint work with Dr. Dwarka and Prof. Vuik
- Contribute to broad research on parallel scalable iterative solvers for large indefinite linear systems
- This presentation: matrix-free parallelization
 - > Complex shift Laplace Preconditioner (CSLP)
 - > Deflation methods
 - > Scalability
 - > Parallel performance

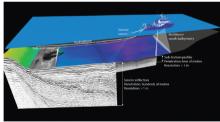

Introduction - the Helmholtz Problem

The Helmholtz equation (describing time-harmonic waves) + BCs

$$-\Delta u\left(\mathbf{x}\right) - k\left(\mathbf{x}\right)^{2} u\left(\mathbf{x}\right) = g\left(\mathbf{x}\right), \text{ on } \Omega \subseteq \mathbb{R}^{n}$$

- > $k\left(\mathbf{x}\right)$ is the wavenumber, $k\left(\mathbf{x}\right)=(2\pi f)/c\left(\mathbf{x}\right)$, where f is the frequency and c is the acoustic velocity of the media
- > Applications in **seismic exploration**, medical imaging, antenna synthesis, etc.

🖹 Larisa, High-performance implementation of Helmholtz equation with absorbing boundary conditions. http://www.math.chalmers.se/~larisa/www/MasterProjects/HelmholtzABSbc.pdf

Introduction - Challenges

Linear system from discretization

$$Au = b$$

- > A is real, sparse, symmetric, normal, and indefinite; non-Hermitian with Sommerfeld BCs
- ? Direct solver or iterative solver
- **A** Accuracy and pollution error $(k^3h^2 < 1)$: finer grid (3D) \Rightarrow larger linear system
 - Memory-efficient methods; High-Performance Computing (HPC)
- **A** Negative & positive eigenvalues: larger wavenumber ⇒ more iterations
 - Preconditioner: Complex Shifted Laplace Preconditioner (CSLP)
 - 🔑 (Higher-order) Deflation
- A Parallelism

Aim

A wavenumber-independent convergent and parallel scalable solver

Introduction - Metrics

- Onvergence metric:
- > Krylov-based solvers, GMRES-type: the number of iterations (#iter)
- Scalability:
 - > Strong scaling: the number of processors is increased while the problem size remains constant
 - > Weak scaling: the problem size increases along with the number of tasks, so the computation per task remains constant
 - \rightarrow Wall-clock time: t_w ; number of processors: np
 - > Speedup: $S_p=\frac{t_{w,r}}{t_{w,p}}$, $E_P=\frac{S_p}{np/np_r}=\frac{t_{w,r}\cdot np_r}{t_{w,p}\cdot np}$

Introduction - Numerical Models

lacktriangle Model problems on a rectangular domain Ω with boundary $\Gamma=\partial\Omega$

$$\begin{split} -\Delta u(\mathbf{x}) - k(\mathbf{x})^2 u(\mathbf{x}) &= \delta \left(\mathbf{x} - \mathbf{x}_0\right), \text{ on } \Omega \\ \frac{\partial u(\mathbf{x})}{\partial \vec{n}} - \mathrm{i} k(\mathbf{x}) u(\mathbf{x}) &= 0, \text{ on } \Gamma \end{split}$$

- > Constant wavenumber: $k(\mathbf{x}) = k$
- > Non-constant wavenumber: Wedge, Marmousi problem
- lacktriangle Finite-difference discretization on a uniform grid with grid size h. (2D example)
 - > Laplace operator:

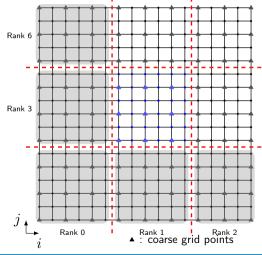

$$-\Delta_h \mathbf{u} \approx \frac{-u_{i,j-1} - u_{i-1,j} + 4u_{i,j} - u_{i+1,j} - u_{i,j+1}}{h^2}$$

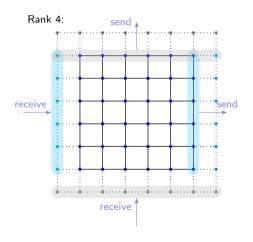

> Sommerfeld BCs: a ghost point

$$\frac{\partial u}{\partial \vec{n}}(0, y_j) - \mathrm{i}k(0, y_j)u(0, y_j) \approx \frac{u_{0,j} - u_{2,j}}{2h} - \mathrm{i}k_{1,j}u_{1,j} = 0 \Rightarrow u_{0,j} = u_{2,j} + 2h\mathrm{i}k_{1,j}u_{1,j}$$

Framework - Distributed data structure

- \rightarrow Vector $\mathbf{u} \Leftarrow 2D$ array: $\mathbf{u}(1:Nx,1:Ny) \Leftarrow$ each sub-domain: $\mathbf{u}(1-LAP:nx+LAP,1-LAP:ny+LAP)$
- > Operations (e.g. matvec, dot-product, vector update) perform on each u(1:nx,1:ny) simultaneously

Framework - Matrix-free operations

▶ Perform computations with a matrix without explicitly forming or storing the matrix
 ⇒ Reduce memory requirements

Matrix-vector multiplication

If a matrix can be represented by a so-called stencil notation

$$[A] = \begin{bmatrix} a_{-1,1} & a_{0,1} & a_{1,1} \\ a_{-1,0} & a_{0,0} & a_{1,0} \\ a_{-1,-1} & a_{0,-1} & a_{1,-1} \end{bmatrix},$$

Then $\mathbf{v} = A\mathbf{u}$ can be computed by

$$v_{i,j} = \sum_{p=-1}^{1} \sum_{q=-1}^{1} a_{p,q} u_{i+p,j+q}$$

with the help of a ghost point on the physical boundary and one overlapping grid point.

Framework - Matrix-free operations

- i Stencil notation
- > Laplace operator:

$$[-\Delta_h] = rac{1}{h^2} \left[egin{array}{ccc} 0 & -1 & 0 \ -1 & 4 & -1 \ 0 & -1 & 0 \end{array}
ight]$$

" Wavenumber operator ":

$$\begin{bmatrix} \mathcal{I}_h \mathbf{k}^2 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & k_{i,j}^2 & 0 \\ 0 & 0 & 0 \end{bmatrix} \stackrel{const}{=} \begin{bmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} k^2$$

 $\rightarrow A\mathbf{u} = \mathbf{b}$:

$$[A_h] = [-\Delta_h] - [\mathcal{I}_h \mathbf{k}^2]$$

CSLP

- Speed up convergence of Krylov subspace methods by Preconditioning
- Solve $M^{-1}Au = M^{-1}b$
- Complex Shifted Laplace Preconditioner (CSLP)

$$M_h = -\Delta_h - (\beta_1 - \beta_2 i) \mathcal{I}_h \mathbf{k}^2, \ (\beta_1, \beta_2) \in [0, 1], \quad e.g. \ \beta_1 = 1, \beta_2 = 0.5$$

- ✓ Stencil notation
- Solve Mx = u by multigrid method (V-cycle) $\Rightarrow x \approx M^{-1}u$
 - > Vertex-centered coarsening based on the global grid
 - > Damped Jacobi smoother (easy to parallelize)
 - > Full-weight restriction I_h^{2h} & linear interpolation I_{2h}^h

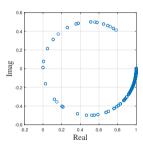

$$[I_h^{2h}] = \frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}_h^{2h}, \ [I_{2h}^h] = \frac{1}{4} \end{bmatrix} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}_{2h}^h$$

- > Coarse-grid operator obtained by re-discretization
 - **Stencil** notation: $[M_{2h}]$ similar to $[M_h]$

J. Chen (TU Delft) Precond24, Atlanta June 10, 2024 10 /

CSLP - Cons

- lacktriangle Increasing $k \Rightarrow$ eigenvalues move fast towards origin
- Too many iterations for high frequency
- Project unwanted eigenvalues to zero ⇒ Deflation

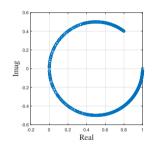

Figure: $\sigma\left(M_{(1.0.5)}^{-1}A\right)$ for k=20 (left) and k=80 (right)

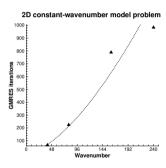

Figure: #Iter increases with k

Deflation - introduction

- Project unwanted eigenvalues to zero ⇒ Deflation
- Deflation preconditioning: solve $PA\hat{u} = Pb$

$$P = I - AQ, \quad \text{where } Q = ZE^{-1}Z^T, \quad E = Z^TAZ$$

$$A \in \mathbb{R}^{n \times n}, Z \in \mathbb{R}^{m \times n}$$

- lacktriangle Columns of Z span deflation subspace
- In practice approximations: inter-grid vectors from multigrid
- lacktriangle Adapted Deflation Variant 1 (A-DEF1): $P_{A-DEF1}=M_{(\beta_1,\beta_2)}^{-1}P+Q$
 - > Combined with the standard preconditioner CSLP
- lacktriangle Use CSLP-preconditioned GMRES to solve the coarse grid problem (obtain E^{-1}) approximately
- Linear approximation basis deflation vectors → higher-order deflation vectors (Adapted Preconditioned DEF, APD)
 - > wavenumber-independent convergence

J. Chen (TU Delft) Precond24, Atlanta June 10, 2024 12/

Two-level deflation - overall algorithm

lacktriangle Flexible GMRES-type methods ightarrow allow for variable preconditioner

Algorithm Two-level deflation FGMRES

```
1: Choose u_0 and dimension k of the Krylov subspace.
 2: Define (k+1) \times k\bar{H}_k and initialize to zero
 3: Compute r_0 = b - Au_0, \beta = ||r_0||, v_1 = r_0/\beta;
 4: for j = 1, 2, ..., k or until convergence do
         \hat{v}_i = Z^T v_i
                                                                                                          ▶ Precondition starts
        \tilde{v} \approx E^{-1} \hat{v}
                                           ▷ Solved by GMRES approximately, preconditioned by CSLP, tol=10<sup>-1</sup>
       t = Z\tilde{v}
        s = At
        \tilde{r} = v_i - s
         r \approx M^{-1}\tilde{r}
                                                                                 ▷ Approximated by one multigrid V-cycle
10.
       x_i = r + t
                                                                                                            ▶ Precondition ends
11:
         w = Ax_i
12:
         for i := 1, 2, ..., j do
13:
            h_{i,j} = (w, v_i)
14:
15:
             w := w - h_{i,i}v_i
         end for
16:
         h_{i+1,i} := ||w||_2, \ v_{i+1} = w/h_{i+1,i}; \ X_k = [x_1,...,x_k]; \ \bar{H}_k = \{h_{i,j}\}_{1 \le i \le j+1,1 \le j \le m}
17:
18: end for
19: u_k = u_0 + X_k y_k where y_k = \arg\min_{u} ||\beta e_1 - \bar{H}_k y||
```

Higher-order deflation vectors

- \triangleright 2D: the higher-order interpolation & restriction has 5×5 stencil
 - > Two overlapping grid points are needed

$$[Z] = \frac{1}{64} \begin{bmatrix} 1 & 4 & 6 & 4 & 1 \\ 4 & 16 & 24 & 16 & 4 \\ 6 & 24 & 36 & 24 & 6 \\ 4 & 16 & 24 & 16 & 4 \\ 1 & 4 & 6 & 4 & 1 \end{bmatrix}^{h}, \quad [Z^{T}] = \frac{1}{64} \begin{bmatrix} 1 & 4 & 6 & 4 & 1 \\ 4 & 16 & 24 & 16 & 4 \\ 6 & 24 & 36 & 24 & 6 \\ 4 & 16 & 24 & 16 & 4 \\ 1 & 4 & 6 & 4 & 1 \end{bmatrix}^{2h}_{h}$$

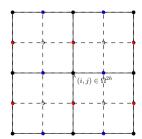

Figure: The allocation map of interpolation operator

Matrix-free two-level deflation

$$P = I - AQ$$
, where $Q = ZE^{-1}Z^T$, $E = Z^TAZ$

> With matrix constructed, $E = Z^T A Z$, so-called Galerkin Coarsening

Matrix-free coarse grid operation y = Ex?

Straightforward Galerkin Coarsening operator;

$$x_1 = Zx, \ x_2 = A_h x_1, \ y = Z^T x_2 \Rightarrow y = Ex$$

- > unacceptable computational cost for consideration of multilevel method
- Re-discretization:
 - \mathbf{P} **ReD**- \mathcal{O} **2**: The same as the fine grid
 - **ReD-***O***4**: Fourth-order re-discretization of the Laplace operator

$$[E] = \frac{1}{12 \cdot (2h)^2} \begin{bmatrix} 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & -16 & 0 & 0 \\ 1 & -16 & 60 & -16 & 1 \\ 0 & 0 & -16 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \end{bmatrix} - \mathcal{I}_{2h} \mathbf{k}_{2h}^2$$

Matrix-free two-level deflation

ReD-Glk: Re-discretized scheme (stencil) from the result of Galerkin coarsening

$$[-\Delta_{2h}] = \frac{1}{(2h)^2} \cdot \frac{1}{256} \begin{bmatrix} -3 & -44 & -98 & -44 & -3\\ -44 & -112 & 56 & -112 & -44\\ -98 & 56 & 980 & 56 & -98\\ -44 & -112 & 56 & -112 & -44\\ -3 & -44 & -98 & -44 & -3 \end{bmatrix}$$

$$\Rightarrow -\Delta_{2h}u_{2h} = -4\frac{\partial^2 u}{\partial x^2} - 4\frac{\partial^2 u}{\partial y^2} - (\frac{13}{48}\frac{\partial^4 u}{\partial x^4} + \frac{1}{2}\frac{\partial^4 u}{\partial x^2 \partial y^2} + \frac{13}{48}\frac{\partial^4 u}{\partial y^4})(2\mathbf{h})^2 + \mathcal{O}(h^4)$$

$$[\mathcal{I}_{2h}\mathbf{k}_{2h}^2] = \frac{1}{64^2} \begin{bmatrix} 1 & 28 & 70 & 28 & 1\\ 28 & 784 & 1960 & 784 & 28\\ 70 & 1960 & 4900 & 1960 & 70\\ 28 & 784 & 1960 & 784 & 28\\ 1 & 28 & 70 & 28 & 1 \end{bmatrix} \mathbf{k}_{2h}^2$$

$$\Rightarrow [E] = [-\Delta_{2h}] - [\mathcal{I}_{2h}\mathbf{k}_{2h}^2]$$

? Boundary conditions - ReD- $\mathcal{O}2$ on the boundary grid points

J. Chen (TU Delft) Precond24, Atlanta June 10, 2024 16

```

Multilevel deflation - V-cycle

Remark

 $\exists \tilde{m}: \text{for } m>\tilde{m},\, E_m \text{ is negative}$ definite. For $m\leq \tilde{m},\, E_m$ is indefinite.

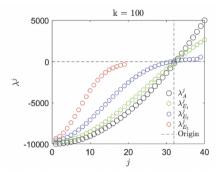

Figure: Spectrum of the coarse linear systems for k=100 and kh=0.3125.

Table: Number of outer FGMRES-iterations and CPU time required for the Wedge problem with kh=0.35. The coarse-grid systems become **negative definite** from the **4th level**.

		Three-level		Fou	r-level
f (Hz)	Grid size	Outer	CPU	Outer	CPU
		#iter	time (s)	#iter	time (s)
20	145×241	7	3.78	8	7.00
40	289×481	7	20.14	9	103.31
80	577×961	8	195.14	11	907.00
160	1153×1921	8	1060.50	13	5101.73

- V-cycle: coarsening needs to remain on indefinite levels
- What about coarsening to **negative definite** levels?

Multilevel deflation - a robust and efficient variant

For the scenario of coarsening to **negative definite** levels:

- A tolerance for the second level (L2) (instead of one FGMRES iteration)
 - > L2 tol= 1×10^{-1} \rightarrow close to constant outer iterations
 - > L2 tol= 3×10^{-1} → extra outer iterations but reduced computation time ✓
- One iteration for the other coarse levels including the coarsest level
- CSLP: the first and second levels: multigrid method (one V-cycle); the other coarse levels: Krylov iterations (GMRES), tol= 1×10^{-1}

Table: Number of outer FGMRES-iterations and sequential CPU time required to solve the Marmousi problem. For kh=0.54, the coarse-grid systems become negative definite from the 3rd level. In parentheses are the number of iterations to solve the second-level grid system.

		Two-level, L2 tol= 1×10^{-1}		Five-level, L2	Five-level, L2 tol= 1×10^{-1}		Five-level, L2 tol= 3×10^{-1}	
f (Hz)	Grid size	Outer #iter	CPU	Outer #iter	CPU	Outer #iter	CPU	
j (mz) Grid size	(L2 #iter)	time (s)	(L2 #iter)	time (s)	(L2 #iter)	time (s)

10241×10241	104,878,081	256	13	79.69
20481×20481	419,471,361	1024	13	93.62

Table: Weak scaling for the Wedge model problem with $f = 320 \,\mathrm{Hz}$.

Grid size	#unknowns (N)	np	#iter	CPU time (s)
2305×3841	8,853,505	48	16	69.75
4609×7681	35,401,729	192	14	53.20
9217×15361	141,582,337	768	14	67.03

Good weak scalability for large wavenumber - in the context of minimizing pollution error by grid refinement.

Parallel performance - Strong scaling

Table: The number of iterations required and computation time, along with the resulting speedup (Sp) and parallel efficiency (Ep), to solve the Wedge problem with a grid size 4609×7681 and $f=320\,\mathrm{Hz}$ on one compute node of DelftBlue.

np	CPU time (s)	Sp	Ep
1	4064.63	-	-
2	2029.36	2.00	1.00
6	686.19	5.92	0.99
12	343.05	11.85	0.99
24	186.67	21.77	0.91
48	120.29	33.79	0.70
64	100.19	40.57	0.63

 Good strong scalability for massively parallel computing

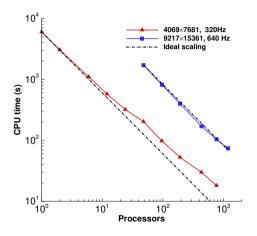

Figure: Strong scaling for Wedge problem

Conclusions and Perspectives

- **⊘** Robust parallel multilevel deflation for high-frequency heterogeneous problems
- Parallel framework with fairly good weak and strong scaling
- Generalize to large-scale 3D applications
